Why Edge Computing?

• Latency: Reduces delay for real-time responses

• Resilience: Operates even with cloud disconnections

- Bandwidth: Minimizes data transfer volume
- D. K. St. L. L.
- Privacy: Keeps sensitive data local

Edge Computing works similarly, by processing data closer to the source rather than relying on the cloud. Key benefits include:

- **Latency:** Processing data locally reduces delays, which is vital for applications like smart cars or real-time sensors. - **Privacy:** Keeping sensitive data local minimizes the risk of exposure, especially in industries like healthcare. - **Bandwidth:** Instead of transmitting all data to the cloud, only relevant information is sent, reducing the need for high bandwidth. - **Resilience:** Edge devices continue to function even without cloud connectivity, ensuring uninterrupted service in critical situations.

These benefits make Edge Computing essential for fast, private, and reli-

able applications, even when cloud services are unavailable.

As the company grows, real-time decisions are needed, making cloud com-

puting inefficient. Instead, they hire an in-house accountant to process

Open Discussion

Discussion Point

Edge computing reduces data exchanges by processing locally. But: With network demands constantly rising, will edge computing be enough?

Or is it just a temporary relief before a new saturation point?
